

# 800M **FREE** AI TOKENS

A GitHub repo that claims to route your requests across the free tiers of GPT-4, Claude, Gemini, Llama and Mistral, and jump to the next model when one hits its limit.

## The idea

Every AI company gives a free tier with a rate limit. The repo spreads your requests over all of them, so you rarely run out.

**Verify first:** the "800 million tokens a month" figure comes from the original creator. Open the repo, read its README and test it yourself. Some providers' terms may not allow pooling free tiers, so check each one.

# The usual flow

- 1 **Open the repo.** Use the link I send you in DM, and check its stars, license and recent commits.
- 2 **Read the README.** Follow its exact install steps. Every repo is a bit different.
- 3 **Get free API keys.** Make a free account with each provider you want (OpenAI, Anthropic, Google, Meta Llama hosts, Mistral) and create a key.
- 4 **Add the keys to the config.** Put them in the repo's config or `.env` file. Never commit keys to GitHub.

```
.env
OPENAI_API_KEY=your-key
ANTHROPIC_API_KEY=your-key
GEMINI_API_KEY=your-key
```

- 5 **Run it and point your tools at it.** Tools then send requests to the repo, and it picks a model with free quota left.

# Before you **use it**

## Keys

Use new keys made for this, set spending limits where the provider allows, and never paste keys into chats or public repos.

## Privacy

Your prompts go to several companies. Don't send private data, passwords or client work through it.

## Terms

Read each provider's terms. Some free tiers forbid sharing or combining access.

## Reality check

Free tiers change or end without notice. Treat this as a bonus, not something your product depends on.

## DM "hello" for the repo link
